

That must have been a heck of a thunder and lightening storm last night. I was on the road and did not see it myself. When I got home, my computer was off and the wireless control for my sun room lamps wouldn't work. The computer came back on OK and I fixed the sunroom lights by unplugging and plugging in the wireless wall socket module. My sunroom air conditioner would not work either and it later cost two months and \$208 just to use the remote to reprogram it. Actually I was happy because I was ready to spend \$1,500 for a new one.

Then two residents called to say they thought the lightening had zapped their printers. A simple unplugging and plugging their printer power supplies modules from the wall fixed the printer problems too.

No charge for simple problem fixed over the phone, especially for former clients.
